

Rayvathy Rajagopalan 1193 20 742590 ; Ms

55 YEAR OLD MALE WITH A LARGE SUBCUTANEOUS LIPOMA ON THE BACK, NOT CLINICALLY SUSPICIOUS BUT 13CM. NO PREVIOUS RMH HISTOLOGY.

MACROSCOPY

Site not stated on specimen pot: 6 fatty cores ranging from 7-12mm. 1-6) AE.

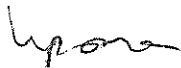

HISTOLOGY

Cores of fibroadipose tissue with adipose tissue of mature type with focal intersection by sparsely cellular fibrous septa. No cellular atypia, tumour necrosis or mitotic figures are seen.

The features are consistent with lipoma. No atypical features are noted in this material, and while lipoma-like atypical lipomatous tumour appears highly unlikely from these appearances, in view of the size, **FISH for MDM2 amplification status, with a further report to follow.**

Dr Magnus Hallin/Dr Khin Thway

T: soft tissue T BACK M

A handwritten signature in black ink, appearing to read 'Lipoma'.
